

SDF-Based Confidence Aggregation (Example)

Step 1: Observer SDF Values

Step 2: Compute Confidence ($\lambda=10$)

Step 3: Normalize (Softmax)

Step 4: Weighted Aggregation

$$\bar{p} = \sum \alpha_i \cdot p_i = 0.201 \cdot p_1 + 0.193 \cdot p_2 + 0.211 \cdot p_3 + 0.187 \cdot p_4 + 0.207 \cdot p_5$$

Step 5: Generate Latent Parameters
